

Solar System Review

We live in an ancient solar system. When we look at the sky, we can see the moon, sun, and stars. Earth is one of eight planets in our solar system. Our solar system, located in the Milky Way galaxy, contains many more objects than what can be seen by the naked eye. These objects include gas, dust, a number of dwarf planets, more than 170 named moons, and thousands of comets and asteroids.

Planets in our Solar System

There are eight planets in our solar system. Planets revolve, or move around, the sun. The order of the planets according to their distances from the sun is:

Using a simple mnemonic device will help you to easily remember the planets in order. Just remember this:
**My Very Educated Mother
Just Served Us Nachos!**

There are four terrestrial planets and four gas giants. The terrestrial planets are also known as the inner planets, while the gas giants are also known as the outer planets. Terrestrial planets have solid surfaces, while gas giants do not. Each of the gas giants have rings, though Saturn's are the most visible!

The order of the planets from largest to smallest is:
Jupiter, Saturn, Uranus, Neptune, Earth, Venus, Mars, Mercury

You can remember it using this mnemonic device:
JULIE (Jason) Eats Very Many Meatballs

In addition to the planets in our solar system, there are a number of dwarf planets. Dwarf planets orbit the sun, but cross the orbital paths of other planets. Pluto used to be considered the ninth planet, but it is now considered a dwarf planet. Other dwarf planets in our solar system are Eris, Ceres, Haumea, and Makemake.
