Statistical Image Processing and Multidimensional Modeling: Modelling of random fields Paul Fieguth, 2011

Statistical Image Processing and Multidimensional Modeling Paul Fieguth, 2010-10-17 Images are all around us The proliferation of low cost high quality imaging devices has led to an explosion in acquired images When these images are acquired from a microscope telescope satellite or medical imaging device there is a statistical image processing task the inference of something an artery a road a DNA marker an oil spill from imagery possibly noisy blurry or incomplete A great many textbooks have been written on image processing However this book does not so much focus on images per se but rather on spatial data sets with one or more measurements taken over a two or higher dimensional space and to which standard image processing algorithms may not apply There are many important data analysis methods developed in this text for such statistical image problems Examples abound throughout remote sensing satellite data mapping data assimilation climate change studies land use medical imaging organ segmentation anomaly detection computer vision image classification segmentation and other 2D 3D problems biological imaging porous media The goal then of this text is to address methods for solving multidimensional statistical problems The text strikes a balance between mathematics and theory on the one hand versus applications and algorithms on the other by deliberately developing the basic theory Part I the mathematical modeling Part II and the algorithmic and numerical methods Part III of solving a given problem The particular emphases of the book include inverse problems multidimensional modeling random fields and hierarchical methods *The Probabilistic Vision of the Physical World* Fernando Sansò, Alberta Albertella, 2025-06-16 This book investigates the relationship between empirical reality and theoretical modelling in Earth sciences focusing on how empirical experiments and theoretical models interact It explores the connection between statistics and probability theory emphasizing the importance of these tools in understanding the physical world The first chapter addresses the frequency probability antinomy while the second chapter discusses the sources of randomness in modelling Chapters 3 and 4 delve into statistical inference covering estimation theory and testing theory Chapter 5 examines the relationship between discrete finite models and continuous infinite dimensional models particularly random fields making the concepts accessible to geodesists and geophysicists Chapter 6 explores modern machine learning and deep learning highlighting their roots in traditional statistical methods and neural networks The book concludes with a caution against relying solely on empirical evidence and black box algorithms advocating for the integration of physical laws with empirical models to advance understanding of the physical world The book is primarily intended for graduate students and researchers in the field of earth sciences with a basic background in probability theory and statistics

Advanced Information Systems Engineering Matthias Jarke, Andreas Oberweis, 1999-06-09 This book constitutes the refereed proceedings of the 11th International Conference on Advanced Information Systems Engineering CAiSE 99 held in Heidelberg Germany in June 1999 The 27 revised full papers presented together with 12 short research papers and two

An Introduction to Spatial Data Science with GeoDa Luc Anselin, 2024-05-29. This book is the second in a two-volume series that introduces the field of spatial data science. It moves beyond pure data exploration to the organization of observations into meaningful groups, i.e., spatial clustering. This constitutes an important component of so-called unsupervised learning, a major aspect of modern machine learning. The distinctive aspects of the book are both to explore ways to spatialize classic clustering methods through linked maps and graphs, as well as the explicit introduction of spatial contiguity constraints into clustering algorithms. Leveraging a large number of real-world empirical illustrations, readers will gain an understanding of the main concepts and techniques and their relative advantages and disadvantages. The book also constitutes the definitive user's guide for these methods as implemented in the GeoDa open-source software for spatial analysis. It is organized into three major parts dealing with dimension reduction, principal components, multidimensional scaling, stochastic network embedding, classic clustering methods, hierarchical clustering, k -means, k -medians, k -medoids, and spectral clustering, and spatially constrained clustering methods, both hierarchical and partitioning. It closes with an assessment of spatial and non-spatial cluster properties. The book is intended for readers interested in going beyond simple mapping of geographical data to gain insight into interesting patterns as expressed in spatial clusters of observations. Familiarity with the material in Volume 1 is assumed, especially the analysis of local spatial autocorrelation and
