Mathematical Formulas for Economists Bernd Luderer, Volker Nollau, Klaus Vettters, 2013-06-29 This collection of formulas constitutes a compendium of mathematics for economics and business. It contains the most important formulas, statements, and algorithms in this significant subfield of modern mathematics and addresses primarily students of economics or business at universities, colleges, and trade schools. But people dealing with practical or applied problems will also find this collection to be an efficient and easy-to-use work of reference. First, the book treats mathematical symbols and constants, sets, and statements, number systems, and their arithmetic, as well as fundamentals of combinatorics. The chapter on sequences and series is followed by mathematics of finance, the representation of functions of one and several independent variables, their differential and integral calculus, and by differential and difference equations. In each case, special emphasis is placed on applications and models in economics. The chapter on linear algebra deals with matrices, vectors, determinants, and systems of linear equations. This is followed by the representation of structures and algorithms of linear programming. Finally, the reader finds formulas on descriptive statistics, data analysis, ratios, inventory, and time series analysis, on probability theory, events, probabilities, random variables, and distributions, and on inductive statistics, point and interval estimates, tests. Some important tables complete the work.

Introductory Course On Financial Mathematics Michael Tretyakov, 2013-07-23 This book is an elementary introduction to the basic concepts of financial mathematics with a central focus on discrete models and an aim to demonstrate simple but widely used financial derivatives for managing market risks. Only a basic knowledge of probability, real analysis, ordinary differential equations, linear algebra, and some common sense are required to understand the concepts considered in this book. Financial mathematics is an application of advanced mathematical and statistical methods to financial management and markets with a main objective of quantifying and hedging risks. Since the book aims to present the basics of financial mathematics to the reader, only essential elements of probability and stochastic analysis are given to explain ideas concerning derivative pricing and hedging. To keep the reader intrigued and motivated, the book has a sandwich structure: probability and stochastics are given *in situ* where mathematics can be readily illustrated by application to finance. The first part of the book introduces one of the main principles in finance: no arbitrage pricing. It also introduces main financial instruments such as forward and futures contracts, bonds, and swaps, and options. The second part deals with pricing and hedging of European and American type options in the discrete time setting. In addition, the concept of complete and incomplete markets is discussed. Elementary probability is briefly revised, and discrete time, discrete space stochastic processes used in financial modelling are considered. The third part introduces the Wiener process, Ito integrals, and

stochastic differential equations but its main focus is the famous Black Scholes formula for pricing European options Some guidance for further study within this exciting and rapidly changing field is given in the concluding chapter There are approximately 100 exercises interspersed throughout the book and solutions for most problems are provided in the appendices
