Structural Dynamic Analysis with Generalized Damping Models Sondipon Adhikari, 2013-12-11 Since Lord Rayleigh introduced the idea of viscous damping in his classic work The Theory of Sound in 1877 it has become standard practice to use this approach in dynamics covering a wide range of applications from aerospace to civil engineering However in the majority of practical cases this approach is adopted more for mathematical convenience than for modeling the physics of vibration damping Over the past decade extensive research has been undertaken on more general non viscous damping models and vibration of non viscously damped systems This book along with a related book Structural Dynamic Analysis with Generalized Damping Models Identification is the first comprehensive study to cover vibration problems with general non viscous damping The author draws on his considerable research experience to produce a text covering dynamics of viscously damped systems non viscously damped single and multi degree of freedom systems linear systems with non local and non viscous damping reduced computational methods for damped systems and finally a method for dealing with general asymmetric systems The book is written from a vibration theory standpoint with numerous worked examples which are relevant across a wide range of mechanical aerospace and structural engineering applications

Mechanics of Aeronautical Solids, Materials and Structures Christophe Bouvet, 2017-04-24 The objective of this work on the mechanics of aeronautical solids materials and structures is to give an overview of the principles necessary for sizing of structures in the aeronautical field It begins by introducing the classical notions of mechanics stress strain behavior law and sizing criteria with an emphasis on the criteria specific to aeronautics such as limit loads and ultimate loads Methods of resolution are then presented and in particular the finite element method Plasticity is also covered in order to highlight its influence on the sizing of structures and in particular its benefits for design criteria Finally the physics of the two main materials of aeronautical structures namely aluminum and composite materials is approached in order to clarify the sizing criteria stated in the previous chapters Exercises with detailed corrections then make it possible for the reader to test their understanding of the different subjects
