Hernández,C.A. Brebbia,W.P. De Wilde,2016-11-28 Containing papers from the 2nd High Performance Design of Structures and Materials and the Optimum Design of Structures conference following the success of a number of meetings since 1989 this book will be of interest to those in any engineering field The use of novel materials and new structural concepts nowadays is not restricted to highly technical areas like aerospace aeronautical applications or the automotive industry but affects all engineering fields including those such as civil engineering and architecture Most high performance structures require the development of a generation of new higher

performance sustainable materials which can more easily resist a range of external stimuli or react in a non conventional manner Emphasis is placed on intelligent structures and materials as well as the application of computational methods for their modelling control and management Optimisation problems of interest involve those related to size shape and topology of structures and materials Optimisation techniques have much to offer to those involved in the design of new industrial products The development of new algorithms and the appearance of powerful commercial computer codes with easy to use graphical interfaces have created a fertile field for the incorporation of optimisation into the design process in all engineering disciplines The book addresses the topic of design optimisation with welcomed contributions on numerical methods different optimisation techniques and new software Several of the topics covered are Composite materials and structures Material characterisation Experiments and numerical analysis Transformable structures Environmentally friendly and sustainable structures Evolutionary methods in optimisation Aerospace structures Biomechanics application and Pneumatic structures

Modeling and Control of Antennas and Telescopes Wodek Gawronski, 2008-07-11 Mechanical engineering and engineering discipline born of the needs of the industrial revolution is once again asked to do its substantial share in the call for industrial renewal. The general call is urgent as we face profound issues of productivity and competitiveness that require engineering solutions among others. The Mechanical Engineering Series is a series featuring graduate texts and research monographs intended to address the need for information in contemporary areas of mechanical engineering. The series is conceived as a comprehensive one that covers a broad range of concentrations important to mechanical engineering graduate education and research. We are fortunate to have a distinguished roster of series editors, each an expert in one of the areas of concentration. The names of the series editors are listed on page vi of this volume. The areas of concentration are applied mechanics, biomechanics, computational mechanics, dynamic systems and control, energetics, mechanics of materials, processing, thermal science and tribology.

Preface This book is based on my experience with the control systems of antennas and radiotelescopes. Overwhelmingly it is based on experience with the NASA Deep Space Network (DSN) antennas. It includes modeling the antennas, developing control algorithms, testing system identification, performance evaluation and troubleshooting. My previous book emphasized the theoretical aspects of antenna control engineering, while this one describes the application part of the antenna control engineering.

Dynamics of Rotating Systems Giancarlo Genta, 2007-01-04 The aim of the book is to give an up-to-date review of rotor dynamics dealing with basic topics as well as a number of specialized topics usually available only in journal articles. Part I deals with the classical topics of rotor dynamics: the dynamic behavior of linear steady-state rotating machines, simple models as well as systems with many degrees of freedom obtained from finite element models. Part II, advanced rotor dynamics, deals with some specialized topics on rotors, bearings, discs and blades.
