Luque-Moreno,2024-02-09 Neurorehabilitation is a complex and growing field of motor rehabilitation It is specifically directed to apply restorative techniques to stimulate neural plasticity of the central nervous system CNS Considering that neuroplasticity is maintained for the whole human life and can be stimulated through specific learning or exposure to enriched environments we can hypothesize that applying specific treatments can be beneficial for people with CNS injury Because the plateau of neuroplasticity can be observed after about 12 weeks from stroke onset it is vital to capitalize on this high level of brain reorganization by providing well timed and well designed treatments Here we can distinguish a wide range of approaches developed for CNS recovery in acute subacute or chronic stage of injury These approaches comprise

priming or augmentation techniques including innovative technologies like end effector robots exoskeletons or virtual reality. Many of them have been confirmed as effective but so far in clinical practice we can still experience a lack of specific indications i.e. which therapy for how long time and for which patient's impairment can be applied.
