Structured System Programming Prentice Hall International Series In Computing Science:

Software Engineering with Computational Intelligence Taghi M. Khoshgoftaar, 2012-12-06 The constantly evolving technological infrastructure of the modern world presents a great challenge of developing software systems with increasing size complexity and functionality The software engineering field has seen changes and innovations to meet these and other continuously growing challenges by developing and implementing useful software engineering methodologies Among the more recent advances are those made in the context of software portability formal verification techniques software measurement and software reuse However despite the introduction of some important and useful paradigms in the software engineering discipline their technological transfer on a larger scale has been extremely gradual and limited For example many software development organizations may not have a well defined software assurance team which can be considered as a key ingredient in the development of a high quality and dependable software product Recently the software engineering field has observed an increased integration or fusion with the computational intelligence CI field which is comprised of primarily the mature technologies of fuzzy logic neural networks genetic algorithms genetic programming and rough sets Hybrid systems that combine two or more of these individual technologies are also categorized under the CI umbrella Software engineering is unlike the other well founded engineering disciplines primarily due to its human component designers developers testers etc factor The highly non mechanical and intuitive nature of the human factor characterizes many of the problems associated with software engineering including those observed in development effort estimation software quality and reliability prediction software design and software testing

Methods of Programming M. Broy, 1991 The systematic development of software systems is a central task of computing science A software system is the result of putting together knowledge about the application the requirements and the structures of computing science Under the heading CIP Computer aided Intuition guided Programming a group of researchers led by Prof F L Bauer and Prof K Samelson started work in 1975 in the direction of formal program specification transformational programming and tool support for program development The collection of papers in this volume presents examples of a formal approach to programming language concepts and program development based on algebraic specifications and program transformations Examples are also presented of evolutions and modifications of the original ideas of the CIP project The topics range from descriptions of the program development process to derivations of algorithms from specifications The volume is dedicated to Prof F L Bauer PUBLISHER S WEBSITE

Category Theory for Computing Science Michael Barr, Charles Wells, 1990 Textbook for advanced undergraduates graduates and researchers in computing science and mathematics expounds the basic ideas and construction of category theory with examples from and applications to computing science The emphasis is on examples and on understanding the concepts rather than on formal proofs of the theorems Annotation copyright

Specification and Development of Interactive Systems Manfred Broy, Ketil Stølen, 2012-12-06 This book presents a fundamental mathematical and logical approach to software and systems engineering Considering the large number of books describing mathematical approaches to program development it is important to explain what we consider to be the specific contribution of our book to identify our goals and to characterize our intended target audience Most books dealing with the mathematics and logics of programming and system development are mainly devoted to programming in the small This is in contrast to our book where the emphasis is on modular system development with the help of component specifications with precisely identified interfaces and refinement concepts Our book aims at systems development carried out in a systematic way based on a clear mathematical theory We do not claim that this book presents a full blown engineering method In fact this is certainly not a book for the application driven software engineer looking for a practical method for system development in an industrial context It is much rather a book for the computer scientist and the scientifically interested engineer who looks for basic principles of system development and moreover its mathematical foundations It is also a book for method builders interested in a proper mathematical foundation on which they can build a practical development method and industrial strength support tools

The Future of Software Engineering Sebastian Nanz, 2010-10-20 This book focuses on defining the achievements of software engineering in the past decades and showcasing visions for the future It features a collection of articles by some of the most prominent researchers and technologists who have shaped the field Barry Boehm Manfred Broy Patrick Cousot Erich Gamma Yuri Gurevich Tony Hoare Michael A Jackson Rustan Leino David L Parnas Dieter Rombach Joseph Sifakis Niklaus Wirth Pamela Zave and Andreas Zeller The contributed articles reflect the authors individual views on what constitutes the most important issues facing software development Both research and technology oriented contributions are included The book provides at the same time a record of a symposium held at ETH Zurich on the occasion of Bertrand Meyer's 60th birthday
