**The Mathematics of Reservoir Simulation** Richard E. Ewing, 2014-12-01 This book describes the state of the art of the mathematical theory and numerical analysis of imaging Some of the applications covered in the book include computerized tomography magnetic resonance imaging emission tomography electron microscopy ultrasound transmission tomography industrial tomography seismic tomography impedance tomography and NIR imaging *Mathematical Modeling for Flow and Transport Through Porous Media* Gedeon Dagan, Ulrich Hornung, Peter Knabner, 2013-06-29 The main aim of this paper is to present some new and general results applicable to the equations of two phase flow as formulated in geothermal reservoir engineering Two phase regions are important in many geothermal reservoirs especially at depths of order several hundred metres where rising essentially isothermal single phase liquid first begins to boil The fluid then continues to rise with its temperature and pressure closely following the saturation boiling curve appropriate to the fluid composition Perhaps the two most interesting theoretical aspects of the idealised two phase flow equations in geothermal reservoir engineering are that firstly only one component water is involved and secondly that the densities of the two phases are so different This has led to the approximation of ignoring capillary pressure The main aim of this paper is to analyse some of the consequences of this assumption especially in relation to saturation changes within a uniform porous medium A general analytic treatment of three dimensional flow is considered Previously three dimensional modelling in geothermal reservoirs have relied on numerical simulators In contrast most of the past analytic work has been restricted to one dimensional examples Nonlinear Hyperbolic Problems: Theoretical, Applied, and Computational Aspects Andrea Donato, Francesco Oliveri, 2013-03-08 **Mathematical Modeling of Groundwater Pollution** Ne-Zheng Sun, Alexander Sun, 2014-07-08 Groundwater is one of the most important resources in the world In many areas water supplies for industrial domestic and agricultural uses are dependent on groundwater As an open system groundwater may exchange mass and energy with its neighboring systems soil air and surface water through adsorption ion exchange infiltration evaporation inflow outflow and other exchange forms Consequently both the quantity and quality of groundwater may vary with environmental changes and human activities Due to population growth and industrial and agricultural development more and more groundwater is extracted especially in arid areas If the groundwater management problem is not seriously considered over extraction may lead to groundwater mining salt water intrusion and land subsidence In fact the quality of groundwater is gradually deteriorating throughout the world The problem of groundwater pollution has appeared not only in developed countries but also in developing countries Ground water pollution is a serious environmental problem that may damage human health destroy the ecosystem and cause water shortage **Iterative Methods for Solving Linear Systems** Anne Greenbaum, 1997-01-01 Much recent research has concentrated on the efficient solution of large sparse or structured linear systems using iterative methods A language loaded with acronyms for a thousand different algorithms has developed and it is

often difficult even for specialists to identify the basic principles involved Here is a book that focuses on the analysis of iterative methods The author includes the most useful algorithms from a practical point of view and discusses the mathematical principles behind their derivation and analysis Several questions are emphasized throughout Does the method converge If so how fast Is it optimal among a certain class If not can it be shown to be near optimal The answers are presented clearly when they are known and remaining important open questions are laid out for further study Greenbaum includes important material on the effect of rounding errors on iterative methods that has not appeared in other books on this subject Additional important topics include a discussion of the open problem of finding a provably near optimal short recurrence for non Hermitian linear systems the relation of matrix properties such as the field of values and the pseudospectrum to the convergence rate of iterative methods comparison theorems for preconditioners and discussion of optimal preconditioners of specified forms introductory material on the analysis of incomplete Cholesky multigrid and domain decomposition preconditioners using the diffusion equation and the neutron transport equation as example problems A small set of recommended algorithms and implementations is included

Numerical Treatment of Multiphase Flows in Porous Media Zhangxin Chen, Richard E. Ewing, Zhong-Ci Shi, 2008-01-11 The need to predict understand and optimize complex physical and chemical processes occurring in and around the earth such as groundwater contamination oil reservoir production discovering new oil reserves and ocean hydrodynamics has been increasingly recognized Despite their seemingly disparate natures these geoscience problems have many common mathematical and computational characteristics The techniques used to describe and study them are applicable across a broad range of areas The study of the above problems through physical experiments mathematical theory and computational techniques requires interdisciplinary collaboration between engineers mathematicians computational scientists and other researchers working in industry government laboratories and universities By bringing together such researchers meaningful progress can be made in predicting understanding and optimizing physical and chemical processes The International Workshop on Fluid Flow and Transport in Porous media was successfully held in Beijing China August 2-6 1999 The aim of this workshop was to bring together applied mathematicians computational scientists and engineers working actively in the mathematical and numerical treatment of fluid flow and transport in porous media A broad range of researchers presented papers and discussed both problems and current state of the art techniques
