 Supplemental Problems
 Part 2. Crystal Dynamics

2-1. Show that if you substitute the proposed wave solution of Eq. (2.8) into the Newton's Second Law expression of Eq. (2.7), you do get the dispersion relation of Eq. (2.9).

2-2. Consider the dispersion relation for the one-dimensional atomic chain stated in Eq. (2.9).

- Find an expression for the group velocity of a displacement wave traveling along the chain. Recall that the group velocity is dk/dk .
- Find an expression for the maximum angular frequency that the chain can support.
- What is the group velocity if this maximum frequency is the main frequency of the group? Explain why this answer makes sense if you examine the graph of the dispersion relation.
- Find an expression for the phase velocity of a wave at this maximum frequency.

2-3. Let's model copper (fcc lattice with a basis of one atom) as a one-dimensional chain and calculate approximate values for different quantities.

Elastic modulus: $1.2 \times 10^{12} \text{ N/m}^2$
 Density: 8.92 g/cm^3
 Atomic mass: 63.55 amu ($1 \text{ amu} = 1.66 \times 10^{-27} \text{ kg}$)
 Lattice constant: $3.6 \text{ \AA}$

- Find the speed of sound in copper using Eq. (2.3).
- Recall that these sound waves have very long wavelengths compared to a . Show that in this limit, the dispersion relation in Eq. (2.9) gives the speed to be $a\sqrt{K/M}$.
- By equating your answers to (a) and (b), find a value for the spring constant K .
- With this spring constant, show that the maximum frequency that can be supported by the chain is around $3 \times 10^{12} \text{ Hz}$.
- If electromagnetic radiation with this frequency hits a copper object, then it should be strongly absorbed since its energy can be strongly coupled into lattice vibrations. In what part of the spectrum is light with this frequency?

2-4. Let's model gallium arsenide (fcc lattice with a two-atom basis) as a one-dimensional chain with two types of atoms and calculate approximate values for different quantities.

Elastic modulus: $7.55 \times 10^{10} \text{ N/m}^2$
 Density: 5.32 g/cm^3
 Atomic masses: Ga 69.72 amu As 74.92 amu ($1 \text{ amu} = 1.66 \times 10^{-27} \text{ kg}$)
 Lattice constant: $5.65 \text{ \AA}$

- Find the speed of sound in GaAs using Eq. (2.3).
- These sound waves are near point O in the dispersion relation plot in Fig. 2.7. Using this fact, find an approximate value for the spring constant for the chain.
- Now show that the maximum frequency supported by the chain is around $4 \times 10^{12} \text{ Hz}$. This vibration is near point A on the optical branch of the dispersion equation plot. What type of light has this frequency?

2-5. Eq. (2.29) gives the heat capacity due to a single mode of lattice vibration.

Tippens,1985 Physics ,2009 Federal Supplement ,1964 **One-Dimensional Finite Elements** Andreas Öchsner,Markus Merkel,2012-10-05 This textbook presents finite element methods using exclusively one dimensional elements The aim is to present the complex methodology in an easily understandable but mathematically correct fashion The approach of one dimensional elements enables the reader to focus on the understanding of the principles of basic and advanced mechanical problems The reader easily understands the assumptions and limitations of mechanical modeling as well as the underlying physics without struggling with complex mathematics But although the description is easy it remains scientifically correct The approach using only one dimensional elements covers not only standard problems but allows also for advanced topics like plasticity or the mechanics of composite materials Many examples illustrate the concepts and problems at the end of every chapter help to familiarize with the topics
