CHAPTER THREE Discussion Questions

1. **How could a grocery store use inventory to increase the responsiveness of the company's supply chain?**

The logistical driver of inventory encompasses all raw materials, work in process, and finished goods within a supply chain. A grocery store can be more responsive in the eyes of its customers if it offers a broader variety of SKUs and/or maintains a greater quantity of each SKU. A greater quantity of each SKU is problematic for highly perishable items like produce, meat, fish, etc. For these items, a grocery store supply chain should be set up to permit frequent orders so that freshness is ensured and a stockout situation won't exist for a significant length of time. A grocery store supply chain should use historical demand patterns for seasonal items to relieve stress on all members and provide customers with product during peak demand periods.

2. **How could an auto manufacturer use transportation to increase the efficiency of its supply chain?**

Transportation, a logistical driver, entails moving inventory from point to point in the supply chain. The trade-off in transportation is between the cost of transportation and the speed at which product is transported. Slower modes of transportation reduce cost, but could be a reasonable approach if suppliers are co-located with the assembly operations. If the supply chain is designed in such a way, and assembly operations are located with proximity to markets, then the supply chain can be run cheaply without holding too much inventory in transit.

3. **How could a bicycle manufacturer increase responsiveness through its facilities?**

Facilities, another logistical driver, are the actual physical locations in the supply chain network where product is stored, assembled, or fabricated. A facility that is designed to be flexible can respond quickly to market demands by retooling to produce different models or products, whereas a dedicated facility cannot. Locating a facility close to the market will increase responsiveness at the cost of decreased economies of scale that might be achieved with a centralized location. A facility that is under capacity will be less responsive than a facility that is appropriately sized or has excess capacity.

4. **How could an industrial supplies distributor use information to increase its responsiveness?**
