The Colonisation Of Land Origins And Adaptations Of Terrestrial Animals:

The Colonisation of Land Colin Little, 1983-12-15 The book traces the ways in which terrestrial animals have evolved from aquatic ancestors and discusses the means by which they are adapted to life on land The most important physiological adaptations are those involving salt and water balance the excretion of nitrogen reproductive mechanisms and the sense organ and these are given priority Evidence from fossil history is combined with that from the ecology and physiology of present day species to assess the probable routes along which various evolutionary lines had moved on to land Individual chapters are concerned with specific animal groups and emphasis is placed on comparisons of physiological mechanisms between closely related animals before attempting wider generalisations The book closes with a brief account of the recolonisation of the sea and fresh waters by terrestrial animals

Evolution and Adaptation of Terrestrial Arthropods

John L. Cloudsley-Thompson, 2012-12-06 This book is intended as a textbook for 3rd year undergraduate students as well as postgraduate students It comprises a review of the current opinion regarding the evolution and adaptation of terrestrial arthropods beginning with the paleontological embryological morphological and physiological evidence The implication of size is then considered in relation to life on land A discussion of insect phylogeny and the origin of flight is followed by an account of evolutionary trends in reproduction Further chapters cover adaptations to extreme environments dispersal and migration defensive mechanisms and finally present arguments for the success of the terrestrial arthropods in general

The Marine Flora and Fauna of Hong Kong and Southern China V Brian Morton, 2000-12-01 From 6 25 April 1998 the Tenth International Workshop on the Marine Flora and Fauna of Hong Kong and South China was convened at the Swire Institute of Marine Science of the University of Hong Kong Thirteen scientists from six countries and twenty two scientists and students from Hong Kong investigated aspects of the marine flora and fauna of the Cape d Aguilar Marine Reserve and the southeastern waters of Hong Kong This was to obtain more information about the newly established reserve the only one in Hong Kong and the changes that had taken place on the seabed in the southern waters since they were dredged between 1992 1995 respectively and in the latter case to see if there had been any subsequent benthic recovery The Proceedings of the workshop contains thirty six original research papers dealing with aspects of the taxonomy and anatomy behaviour and physiology of marine life in Hong Kong and Southern China Papers also explore aspects of Hong Kong s marine parks and reserves including the pollution of Hong Kong s marine life with particular reference to the Cape d Aguilar Marine Reserve established only in 1996 and the fauna of its territorial southern waters The Workshop was sponsored by the University of Hong Kong the Croucher Foundation and the K C Wong Foundation so as to bring eminent overseas scientists to Hong Kong to work with their local colleagues and students The success of the workshop concept is self evident in the contents and scope of these proceedings This was the eighth workshop convened in Hong Kong since 1977 and these proceedings have become the single most important body of information on the long term changes that have taken place in its marine

environment over an extended time frame The volumes are also the largest regional repository of information on the marine life of the territorial waters of Hong Kong and the northern rim of the South China Sea For those with any interest in Hong Kong's marine environment therefore this proceedings and its predecessors are essential reading

Phylogeny and Evolution of the Mollusca Winston Ponder, David R. Lindberg, 2008-03-25 Ponder and Lindberg provides a breathtaking overview of the evolutionary history of the Mollusca effectively melding information from anatomy ecology genomics and paleobiology to explore the depths of molluscan phylogeny Its outstanding success is due to thoughtful planning focused complementary contributions from 36 expert authors and careful editing This volume is a must for malacologists Bruce Runnegar Department of Earth and Space Sciences University of California Los Angeles Our understanding of the phylogeny and evolutionary history of the mollusca has been revolutionized over the past two decades through new molecular data and analysis and reinvestigation of morphological characters In this volume Ponder Lindberg and their colleagues do a wonderful job of integrating this work to provide new perspectives on the relationships of the major molluscan clades their evolutionary dynamics and their history Particularly timely is the coverage of molluscan evo devo and genomics Douglas H Erwin Curator of Paleozoic Invertebrates National Museum of Natural History

Lifestyles and Feeding Biology Martin Thiel, Les Watling, 2015 The second volume of The Natural History of the Crustacea Series covering how crustaceans live in a wide range of environments with emphasis on how they exploit food sources

The Biomechanics of Insect Flight Robert Dudley, 2018-06-05 From the rain forests of Borneo to the tenements of Manhattan winged insects are a conspicuous and abundant feature of life on earth Here Robert Dudley presents the first comprehensive explanation of how insects fly The author relates the biomechanics of flight to insect ecology and evolution in a major new work of synthesis The book begins with an overview of insect flight biomechanics Dudley explains insect morphology wing motions aerodynamics flight energetics and flight metabolism within a modern phylogenetic setting Drawing on biomechanical principles he describes and evaluates flight behavior and the limits to flight performance The author then takes the next step by developing evolutionary explanations of insect flight He analyzes the origins of flight in insects the roles of natural and sexual selection in determining how insects fly and the relationship between flight and insect size pollination predation dispersal and migration Dudley ranges widely from basic aerodynamics to muscle physiology and swarming behavior but his focus is the explanation of functional design from evolutionary and ecological perspectives The importance of flight in the lives of insects has long been recognized but never systematically evaluated This book addresses that shortcoming Robert Dudley provides an introduction to insect flight that will be welcomed by students and researchers in biomechanics entomology evolution ecology and behavior

The Diversity of Amphibians and Reptiles John L. Cloudsley-Thompson, 2012-12-06 An introduction to the evolution and adaptation of amphibians and reptiles bridging the gulf between the plethora of popular books and the more advanced texts directed towards the needs of specialist research workers thus making it accessible to

advanced students worldwide Basic principles are explained in non technical terms and the adaptive responses to natural selection which have engendered the diversity of forms that exist in the fossil record and are found in the world today are covered The book also includes the extinct forms such as dinosaurs ichthyosaurs and plesiosaurs In the concluding chapter relationships with mankind and the preservation of diversity are discussed

Physiological Strategies for Gas Exchange and Metabolism A. J. Woakes, M. K. Grieshaber, C. R. Bridges, 1991-03-28 This 1991 book reviews the various metabolic and functional mechanisms that animals possess in order to live successfully in their own particular often unique environments It demonstrates both the diversity of responses that are shown and the underlying principles of gas exchange and transport for a wide range of organisms

Comparative Physiology Interunion Commission on Comparative Physiology, 1987-07-27 This volume examines the extent to which the design and function of terrestrial and aquatic animals are determined by the physicochemical properties of the media in which they live The topic is addressed from the viewpoint of scientists representing a variety of disciplines and approaches Anatomists biochemists biophysicists physiologists and zoologists each contribute their perspectives The general topics examined include respiration acid base balance osmoregulation water and ionic exchanges nutrient acquisition and absorption nitrogen and sulfur metabolism locomotion sensory information and behaviour energy metabolism and temperature and evolution Four or five papers deal with each of these general topics

Life at the Limits David A. Wharton, 2007-07-23 We are fascinated by the seemingly impossible places in which organisms can live There are frogs that freeze solid worms that dry out and bacteria that survive temperatures over 100 C What seems extreme to us is however not extreme to these organisms In this captivating account the reader is taken on a tour of extreme environments and shown the remarkable abilities of organisms to survive a range of extreme conditions such as high and low temperatures and desiccation This book considers how organisms survive major stresses and what extreme organisms can tell us about the origin of life and the possibilities of extraterrestrial life These organisms have an extreme biology which involves many aspects of their physiology ecology and evolution
