Symbolic Rewriting Techniques Progress In Computer Science And Applied Logic:

Symbolic Rewriting Techniques Manuel Bronstein, Johannes Grabmeier, Volker Weispfenning, 2013-03-11 Symbolic rewriting techniques are methods for deriving consequences from systems of equations and are of great use when investigating the structure of the solutions Such techniques appear in many important areas of research within computer algebra the Knuth Bendix completion for groups monoids and general term rewriting systems the Buchberger algorithm for Gr bner bases the Ritt Wu characteristic set method for ordinary differential equations and the Riquier Janet method for partial differential equations This volume contains invited and contributed papers to the Symbolic Rewriting Techniques workshop which was held at the Centro Stefano Franscini in Ascona Switzerland from April 30 to May 4 1995 That workshop brought together 40 researchers from various areas of rewriting techniques the main goal being the investigation of common threads and methods Following the workshops each contribution was formally refereed and 14 papers were selected for publication

Rewriting Techniques and Applications Paliath Narendran, Michael Rusinowitch, 2003-07-31 This book constitutes the refereed proceedings of the 10th International Conference on Rewriting Techniques and Applications RTA 99 held in Trento Italy in July 1999 as part of FLoC 99 The 23 revised full papers presented were carefully selected from a total of 53 submissions Also included are four system descriptions as well as three invited contributions Among the topics covered are constraint solving termination deduction and higher order rewriting graphs complexity tree automata context sensitive rewriting string rewriting and numeration systems etc

Computer Algebra in Scientific Computing Viktor G. Ganzha, Ernst W. Mayr, Evgenii V. Vorozhtsov, 2012-12-06 Proceedings of the Third Workshop on Computer Algebra in Scientific Computing Samarkand Octobe5r 5 9 2000

Number Theoretic Methods in Cryptography Igor Shparlinski, 2012-12-06 The book introduces new techniques which imply rigorous lower bounds on the complexity of some number theoretic and cryptographic problems These methods and techniques are based on bounds of character sums and numbers of solutions of some polynomial equations over finite fields and residue rings It also contains a number of open

problems and proposals for further research We obtain several lower bounds exponential in terms of $\log p$ on the degrees and orders of polynomials algebraic functions Boolean functions linear recurring sequences coinciding with values of the discrete logarithm modulo a prime p at sufficiently many points the number of points can be as small as $p^{1/2}$ He These functions are considered over the residue ring modulo p and over the residue ring modulo an arbitrary divisor d of $p-1$ The case of $d=2$ is of special interest since it corresponds to the representation of the right most bit of the discrete logarithm and defines whether the argument is a quadratic residue We also obtain non trivial upper bounds on the degree sensitivity and Fourier coefficients of Boolean functions on bits of x deciding whether x is a quadratic residue These results are used to obtain lower bounds on the parallel arithmetic and Boolean complexity of computing the discrete logarithm For example we prove that any unbounded fan in Boolean circuit of sublogarithmic depth computing the discrete logarithm modulo p must be of superpolynomial size

Computer Algebra Handbook Johannes Grabmeier, Erich Kaltofen, Volker

Weispfenning, 2012-12-06 Two ideas lie gleaming on the jeweler's velvet The first is the calculus the second the algorithm The calculus and the rich body of mathematical analysis to which it gave rise made modern science possible but it has been the algorithm that has made possible the modern world David Berlinski The Advent of the Algorithm First there was the concept of integers then there were symbols for integers I II III 1 1 1 1 fttt what might be called a sticks and stones representation I II III IV V Roman numerals 1 2 3 4 5 Arabic numerals etc Then there were other concepts with symbols for them and algorithms sometimes for manipulating the new symbols Then came collections of mathematical knowledge tables of mathematical computations theorems of general results Soon after algorithms came devices that provided assistance for carrying out computations Then mathematical knowledge was organized and structured into several related concepts and symbols logic algebra analysis topology algebraic geometry number theory combinatorics etc This organization and abstraction lead to new algorithms and new fields like universal algebra But always our symbol systems reflected and influenced our thinking our concepts and our algorithms

Rewriting Techniques and Applications, 1999 Coding, Cryptography and Combinatorics Keqin Feng, Harald Niederreiter, Chaoping Xing, 2004-06-25 It has long been recognized that there are fascinating connections between coding theory cryptology and combinatorics Therefore it seemed desirable to us to organize a conference that brings together experts from these three areas for a fruitful exchange of ideas We decided on a venue in the Huang Shan Yellow Mountain region one of the most scenic areas of China so as to provide the additional inducement of an attractive location The conference was planned for June 2003 with the official title Workshop on Coding Cryptography and Combinatorics CCC 2003 Those who are familiar with events in East Asia in the first half of 2003 can guess what happened in the end namely the conference had to be cancelled in the interest of the health of the participants The SARS epidemic posed too serious a threat At the time of the cancellation the organization of the conference was at an advanced stage all invited speakers had been selected and all abstracts of contributed talks had been screened by the

program committee. Thus it was decided to call on all invited speakers and presenters of accepted contributed talks to submit their manuscripts for publication in the present volume. Altogether 39 submissions were received and subjected to another round of refereeing. After careful scrutiny 28 papers were accepted for publication.

Symbolic Rewriting Techniques Manuel Bronstein, Johannes Grabmeier, Volker Weispfenning, 1998. Symbolic rewriting techniques are methods for deriving consequences from systems of equations and are of great use when investigating the structure of the solutions. Such techniques appear in many important areas of research within computer algebra: the Knuth-Bendix completion for groups, monoids and general term rewriting systems; the Buchberger algorithm for Gröbner bases; the Ritt-Wu characteristic set method for ordinary differential equations and the Riquier-Janet method for partial differential equations. This volume contains invited and contributed papers to the Symbolic Rewriting Techniques workshop which was held at the Centro Stefano Franscini in Ascona, Switzerland, from April 30 to May 4, 1995. That workshop brought together 40 researchers from various areas of rewriting techniques, the main goal being the investigation of common threads and methods. Following the workshops, each contribution was formally refereed and 14 papers were selected for publication.

Cryptographic Applications of Analytic Number Theory Igor Shparlinski, 2013-03-07. The book introduces new techniques that imply rigorous lower bounds on the complexity of some number theoretic and cryptographic problems. It also establishes certain attractive pseudorandom properties of various cryptographic primitives. These methods and techniques are based on bounds of character sums and numbers of solutions of some polynomial equations over finite fields and residue rings. Other number theoretic techniques such as sieve methods and lattice reduction algorithms are used as well. The book also contains a number of open problems and proposals for further research. The emphasis is on obtaining unconditional rigorously proved statements. The bright side of this approach is that the results do not depend on any assumptions or conjectures. On the downside, the results are much weaker than those which are widely believed to be true. We obtain several lower bounds exponential in terms of $\log p$ on the degrees and orders of polynomials, algebraic functions, Boolean functions, linear recurrence sequences coinciding with values of the discrete logarithm modulo a prime p at sufficiently many points; the number of points can be as small as $p^{1/2}$. These functions are considered over the residue ring modulo p and over the residue ring modulo an arbitrary divisor d of $p-1$. The case of $d=2$ is of special interest since it corresponds to the representation of the rightmost bit of the discrete logarithm and defines whether the argument is a quadratic residue.
