Soil Behaviour And Critical State Soil Mechanics:

Soil Behaviour and Critical State Soil Mechanics David Muir Wood, 1990 Soils can rarely be described as ideally elastic or perfectly plastic and yet simple elastic and plastic models form the basis for the most traditional geotechnical engineering calculations With the advent of cheap powerful computers the possibility of performing analyses based on more realistic models has become widely available One of the aims of this book is to describe the basic ingredients of a family of simple elastic plastic models of soil behaviour and to demonstrate how such models can be used in numerical analyses Such numerical analyses are often regarded as mysterious black boxes but a proper appreciation of their worth requires an understanding of the numerical models on which they are based Though the models on which this book concentrates are simple understanding of these will indicate the ways in which more sophisticated models will perform Soil Behaviour and Critical State Soil Mechanics David Muir Wood (Bauingenieur), 1990

Soil Behaviour and Critical State Mechanics David Muir Wood, 1990 Critical State Behaviour of an Agricultural Soil, 1996 Soils bear natural and artificial structures and sustain agricultural and biological activities Understanding soil behaviour is the key to appropriating the benefits derivable from this material Engineers are usually interested in the mechanical aspect of soil behaviour This involves the study of volume change and shear response to applied stresses In the past soil shear and volume change behaviour were studied independently But many practical problems involve shearing accompanied by volume change therefore it is desirable to consider this interaction

in modelling soil behaviour The critical state theory Roscoe et al 1958 was developed to combine both shear and volume change behaviour of soils Early soil mechanics theories including the critical state theory were developed for saturated soils Because unsaturated soils are encountered in many situations there is the need to adapt earlier theories or to formulate new ones for unsaturated soils The major differences in the physical behaviour of saturated and unsaturated soils are due to an internal stress called matric suction formed at the air water interface in the soil pores Theories developed for unsaturated soil mechanics are based on the inclusion of the effect of matric suction on soil behaviour In this study the applicability of two major frameworks i e critical state theory and unsaturated soil mechanics to the study of agricultural soil behaviour was investigated Soil behaviour was considered within a modified critical state framework that permits the application of critical state theories to an unsaturated soil An experimental program involving tests in a modified state of the art triaxial testing system was undertaken Critical state soil parameters were obtained and state boundaries identified The role of matric suction and soil structure on state parameters are presented Changes in matric suction caused a shift translation in state boundaries while changes in structure cause
