Spatial Complexity Informatics And Wildlife Conservation:

Spatial Complexity, Informatics, and Wildlife Conservation Samuel A. Cushman, Falk Huettmann, 2009-12-21 As Earth faces the greatest mass extinction in 65 million years the present is a moment of tremendous foment and emergence in ecological science With leaps in advances in ecological research and the technical tools available scientists face the critical task of challenging policymakers and the public to recognize the urgency of our global crisis This book focuses directly on the interplay between theory data and analytical methodology in the rapidly evolving fields of animal ecology conservation and management The mixture of topics of particular current relevance includes landscape ecology remote sensing spatial modeling geostatistics genomics and ecological informatics The greatest interest to the practicing scientist and graduate student will be the synthesis and integration of these topics to provide a composite view of the emerging field of spatial ecological informatics and its applications in research and management

Machine Learning for Ecology and Sustainable Natural Resource Management Grant Humphries, Dawn R. Magness, Falk Huettmann, 2018-11-05 Ecologists and natural resource managers are charged with making complex management decisions in the face of a rapidly changing environment resulting from climate change energy development urban sprawl invasive species and globalization Advances in Geographic Information System GIS technology digitization online data availability historic legacy datasets remote sensors and the ability to collect data on animal movements via satellite and GPS have given rise to large highly complex datasets These datasets could be utilized for making critical management decisions but are often messy and difficult to interpret Basic artificial intelligence algorithms i.e. machine learning are powerful tools that are shaping the world and must be taken advantage of in the life sciences In ecology machine learning algorithms are critical to helping resource managers synthesize information to better understand complex ecological systems Machine Learning has a wide variety of powerful applications with three general uses that are of particular interest to ecologists 1 data exploration to gain system knowledge and generate new hypotheses 2 predicting ecological patterns in space and time and 3 pattern recognition for ecological sampling Machine learning can be used to make predictive assessments even when relationships between variables are poorly understood When traditional techniques fail to capture the relationship between variables effective use of machine learning can unearth and capture previously unattainable insights into an ecosystem's complexity Currently many ecologists do not utilize machine learning as a part of the scientific process This volume highlights how machine learning techniques can complement the traditional methodologies currently applied in this field

River Science David J. Gilvear, Malcolm T. Greenwood, Martin C. Thoms, Paul J. Wood, 2016-05-02 River Science is a rapidly developing interdisciplinary field at the interface of the natural sciences engineering and socio-political sciences It recognises that the sustainable management of contemporary rivers will increasingly require new ways of characterising them to enable engagement with the diverse range of stakeholders This volume represents the outcome of research by many of the authors and their colleagues over the last 40 years and

demonstrates the integral role that River Science now plays in underpinning our understanding of the functioning of natural ecosystems and how societal demands and historic changes have affected these systems The book will inform academics policy makers and society in general of the benefits of healthy functioning riverine systems and will increase awareness of the wide range of ecosystem goods and services they provide *New Publications* ,2011 **Global Land-Ocean**

Geospatial Applications Charla M. Burnett,Biswajeet Pradhan,2025-12-09 This book facilitates a deeper understanding of the diverse applications of geographic information systems GIS and remote sensing RS in land and ocean mapping and surveying across different fields and regions bringing forward the best practices and innovations happening worldwide It includes a variety of analytical methodologies used for managing different landscapes and ocean sites and explores how emerging technologies like artificial intelligence will shape the future of digital geospatial surveying and analysis With real world projects and step by step applications this book helps professionals and students in various fields navigate these technologies effectively and stay current with the latest trends Key Features Provides a detailed and thorough overview of GIS and RS applications covering principles and techniques Explores unique insights into practices across North America Europe Asia South America Africa and Oceania offering a broad range of perspectives and practical solutions Includes a range of practical applications and case studies from real world projects that provide valuable lessons and insights from experienced professionals Addresses emerging technologies like artificial intelligence machine learning unmanned aerial vehicles UAVs and augmented reality as applied to geospatial science Breaks down complex concepts into easily understandable language for those new to the field while offering depth for experienced practitioners seeking to broaden their expertise This is an ideal text for professionals working with geospatial information mapping and surveying who seek practical examples innovative approaches and awareness of emerging trends It s suitable for geospatial data analysts planners environmental scientists surveyors disaster management professionals logistics managers and those who work in related fields **Predictive Species and Habitat Modeling in Landscape Ecology** C. Ashton Drew,Yolanda F.

Wiersma,Falk Huettmann,2010-11-25 Most projects in Landscape Ecology at some point define a species habitat association These models are inherently spatial dealing with landscapes and their configurations Whether coding behavioral rules for dispersal of simulated organisms through simulated landscapes or designing the sampling extent of field surveys and experiments in real landscapes landscape ecologists must make assumptions about how organisms experience and utilize the landscape These convenient working postulates allow modelers to project the model in time and space yet rarely are they explicitly considered The early years of landscape ecology necessarily focused on the evolution of effective data sources metrics and statistical approaches that could truly capture the spatial and temporal patterns and processes of interest Now that these tools are well established we reflect on the ecological theories that underpin the assumptions commonly made during species distribution modeling and mapping This is crucial for applying models to questions of global sustainability Due

to the inherent use of GIS for much of this kind of research and as several authors research involves the production of multicolored map figures there would be an 8 page color insert Additional color figures could be made available through a digital archive or by cost contributions of the chapter authors Where applicable would be relevant chapters GIS data and model code available through a digital archive The practice of data and code sharing is becoming standard in GIS studies is an inherent method of this book and will serve to add additional research value to the book for both academic and practitioner audiences

Research Paper RMRS ,1998 Reintroduction of Fish and Wildlife Populations David S. Jachowski,Joshua J. Millspaugh,Paul L. Angermeier,Rob Slotow,2016-09-13 Reintroduction of Fish and Wildlife Populations provides a practical step by step guide to successfully planning implementing and evaluating the reestablishment of animal populations in former habitats or their introduction in new environments In each chapter experts in reintroduction biology outline a comprehensive synthesis of core concepts issues techniques and perspectives This manual and reference supports scientists and managers from fisheries and wildlife professions as they plan reintroductions initiate releases of individuals and manage restored populations over time Covering a broad range of taxonomic groups ecosystems and global regions this edited volume is an essential guide for academics students and professionals in natural resource management

Artificial Intelligence and Animal Ecology Lidia Ghosh,Amiyangshu De,2025-07-29 Artificial Intelligence and Animal Ecology A Review explores the transformative synergy between AI and animal ecology unveiling how cutting edge technology is revolutionizing ecological research and conservation This pioneering book bridges these dynamic fields demonstrating how AI techniques such as evolutionary algorithms and optimization methods both draw inspiration from and advance the study of animal behavior species interactions and environmental adaptation With a strong focus on innovation it examines groundbreaking AI applications from bio inspired algorithms and adaptive learning to breakthroughs in animal communication and behavioral analysis Readers will gain valuable insights into how AI deciphers complex ecological dynamics including navigation vocal communication and interspecies relationships The book also addresses ethical considerations ensuring responsible AI integration in ecological research More than just a review this book is a call to action It empowers researchers conservationists and ecologists to embrace AI driven solutions fostering interdisciplinary collaboration and expanding the frontiers of ecological knowledge As AI continues to evolve Artificial Intelligence and Animal Ecology A Review provides a vital roadmap for addressing environmental challenges with innovation and a deeper appreciation of the natural world

Ecological Systems Rik Leemans,2012-12-12 Earth is home to an estimated 8 million animal species 600 000 fungi 300 000 plants and an undetermined number of microbial species Of these animal fungal and plant species an estimated 75% have yet to be identified Moreover the interactions between these species and their physical environment are known to an even lesser degree At the same time the earth s biota faces the prospect of climate change which may manifest slowly or extremely rapidly as well as a human population set to grow by two billion by 2045 from the

current seven billion Given these major ecological changes we cannot wait for a complete biota data set before assessing planning and acting to preserve the ecological balance of the earth This book provides comprehensive coverage of the scientific and engineering basis of the systems ecology of the earth in 15 detailed peer reviewed entries written for a broad audience of undergraduate and graduate students as well as practicing professionals in government academia and industry The methodology presented aims at identifying key interactions and environmental effects and enabling a systems level understanding even with our present state of factual knowledge
