

NMR (Nuclear Spectroscopy Questions with Answers:

CHM 701 COURSE:

Q1: Give factors which could be used to improve the sensitivity of an NMR experiment

ANSWER:

- Optimize pulse lengths and widths
- Increase temperature and concentration of sample
- Increase magnetic field strength (B)
- Increase number of scans

Q2: Why do we use deuterated solvents to dissolve our samples for NMR?

ANSWER:

- To avoid inundating of the solvent signal – which resounds at different proton frequencies in the sample.
- For frequency lock – the magnetic field strength (B) tends to drift and hence the NMR spectrophotometer can refine in on signal and lock the frequency.

Q3: How does the electronegativity of an atom affect the ^1H chemical shift? Use an examples to show the effect

ANSWER:

- The higher the electronegativity of the atom, the further downfield the signal will be.
- Protons that are attached to carbons which are attached to highly electronegative atoms will exhibit chemical shifts further downfield.
- The more electronegative atoms there are the higher the electron withdrawing effect (due to reduction of valence electron density situated around the proton which is attached to the carbon) and hence causes a de-shielding effect on the proton.

Q4: How does the electronegativity of an atom affect the ^{13}C chemical shift? Use an examples to show the effect

ANSWER:

- The more electronegative atoms there are the higher the electron withdrawing effect (due to reduction of valence electron density situated around the carbon) and hence causes a de-shielding effect on the carbon.

→ Deshielded protons
