## Frontal Lobe

Frontal lobe injury can lead to impairments in short-term memory, often as a consequence of attention deficits and impaired memory retrieval processes.

The frontal lobe is functionally dissociated such that verbal short-term memory tasks selectively activate the left frontal cortex, while spatial short-term memory tasks activate the right posterior dorsal frontal cortex.

The prefrontal cortex (PFC) is one region of the frontal lobe that plays a crucial role in short-term memory and neuroimaging studies have shown that when people are performing tasks to hold items in short-term memory, the PFC becomes active.

## Parietal Lobe

Recent research has indicated that the parietal lobe plays an important role in generating both verbal and visual short-term memory.

Verbal and visual short-term memory seems to rely on the left parietal cortex, while spatial short-term memory involves the right parietal cortex.

## Parietal Lobe

## Medial Temporal Lobe

The medial temporal lobe is heavily implicated in the functioning of long-term memory, but recent findings have suggested it plays a role in the active maintenance of novel information in short-term memory.

One of the most well-studied regions of the MTL is the hippocampus, which plays an important role in consolidating information within the neocortex from short-term to long-term memory.
