Architecture and Mathematics from Antiquity to the Future Kim Williams, Michael J. Ostwald, 2015-02-09 Every age and every culture has relied on the incorporation of mathematics in their works of architecture to imbue the built environment with meaning and order Mathematics is also central to the production of architecture to its methods of measurement fabrication and analysis This two volume edited collection presents a detailed portrait of the ways in which two seemingly different disciplines are interconnected Over almost 100 chapters it illustrates and examines the relationship between architecture and mathematics Contributors of these chapters come from a wide range of disciplines and backgrounds architects mathematicians historians theoreticians scientists and educators Through this work architecture may be seen and understood in a new light by professionals as well as non professionals Volume I covers architecture from antiquity through Egyptian Mayan Greek Roman Medieval Incan Gothic and early Renaissance eras and styles The themes that are covered range from symbolism and proportion to measurement and structural stability From Europe to Africa Asia and South America the chapters span different countries cultures and practices

New Mathematics of Architecture Jane Burry, Mark Burry, 2012-03-27 This carefully researched survey examines how architects now use digital tools and physics to build spatial constructs that would have been inconceivable even ten years ago Architecture has always relied on mathematics to achieve visual harmony structural integrity and logical construction Now digital tools and an increasing interest in physics have given architects the means to describe and build spatial constructs that would have been inconceivable even ten years ago This carefully researched survey of forty six international projects offers an overview of how different strategies are being employed through accessible illustrations and clear text Each section presents case studies of projects by globally recognized architects in diagrams photographs and texts

Graph Vision Theodora Vardouli, 2024-11-12 How a protean mathematical object the graph ushered in new images tools and infrastructures for design and catalyzed a digital future for architecture In *Graph Vision* Theodora Vardouli offers a fresh history of architecture's early entanglements with modern mathematics and digital computing by focusing on a hidden protagonist the graph Fueled by iconoclastic sentiments and skepticism of geometric depiction architects she explains turned to the skeletal underpinnings of their work and with it the graph as a site of representation operation and political possibility Taking the reader on an enthralling journey through a polyvalent mathematical entity Vardouli combines close readings of graphs architectural manifestations as images tools and infrastructures for design with original archival work on research centers that spearheaded mathematical and computational approaches to architecture Structured thematically *Graph Vision* weaves together archival findings on influential research groups such as the Land Use Built Form Studies Center at the University of

Cambridge the Center for Environmental Structure at Berkeley the Architecture Machine Group at the Massachusetts Institute of Technology among others as well as important figures who led or worked in proximity to these groups including Lionel March Christopher Alexander and Yona Friedman Together this material chronicles the emergence of both a new way of seeing and a new prospect for the discipline that prefigured its digital future of a graph vision Vardouli argues that this vision was one of vacillation toward visual appearance Digital approaches to architecture she ultimately reveals were founded on a profound ambivalence toward the visual realm endemic to mid twentieth century architectural and mathematical modernisms

Mathematics of Space George Legendre, 2011-08-29 A new title in the Architectural Design series that explores the potential of computational mathematics in cutting edge design Mathematics has always been a vital tool in the architect's trade but the last fifteen years have seen a sharp rise in the power of computers and has led to computational abilities far beyond anything previously available Modern design software and computing power have changed the traditional role of geometry in architecture and opened up new possibilities enabled by topology non Euclidean geometry and other areas of mathematics With insight from a top notch list of contributors including such notables as Philippe Morel and Fabien Scheurer Mathematics in Space discusses how the advent of computation and information technology has affected the work of contemporary architects This new title in the Architectural Design series updates architectural mathematics since the digital revolution With world class contributors this is an essential resource for anyone interested in the ways computation has transformed the discipline The book explores fascinating issues in modern design most importantly the impact of mathematics on contemporary design creativity For students and practitioners alike Mathematics in Space covers vital topics in a constantly changing discipline

The Architect, 1877 **Architectural Principles in the Age of Cybernetics** Christopher Hight, 2007-12-12 A theoretical history of anthropomorphism and proportion in modern architecture this volume brings into focus the discourse around proportion with current problems of post humanism in architecture alongside the new possibilities made available through digital technologies The book examines how the body and its ordering has served as a central site of architectural discourse in recent decades especially in attempts to reformulate architecture's relationship to humanism modernism and technology Challenging some concepts and categories of architectural history and situates current debates within a broader cultural and technological context Hight makes complex ideas easily accessible Extensively illustrated and written without academic jargon for an informed but non specialized architectural audience this book elucidates the often obscure debates of avant garde architectural discourse and design while demonstrating how these debates have affected everyday places and concepts of architecture As a result it will appeal to professional architects academics and students combining as it does an insightful introduction to the fundamental issues of architectural history and theory over the past fifty years with entirely new formulations of what that history is and means

The Evolution of Computation in Architecture Michael Fox, Bradley Bell, 2024-10-31 This book is the first comprehensive

overview of the pioneering works events and people that contributed to the paradigm shift defined by computation in architecture Only recently has computation fostered profound new ways of designing fabricating constructing and thinking about architecture While the profession sits at the end of the beginning of this historically transformative shift it is now possible to look back upon the rapidly maturing landscape of projects influencers and tools that have finally begun to catch up with the visionary thinking of the past Readers are guided through the fascinating and fast paced historical timeline of the development of computation in architecture Beginning with an account of the pioneering futuristic thinkers the authors then guide the reader through the birth of computation the appropriation of tools and the impact of experimentation on the profession leading into the legitimacy of research and how paradigms have been expanded The examples and influences are presented in a way that they can be understood and built upon This book is a must read for students of computation in architecture as well as researchers and practicing architects thinking about how the tools we use and the ways we design our buildings and environments with them can truly impact our lives
