XUV Pump-Probe Experiments on Diatomic Molecules Kirsten Schnorr, 2014-12-29 This book explores the relaxation dynamics of inner valence ionized diatomic molecules on the basis of extreme ultraviolet pump probe experiments performed at the free electron laser FEL in Hamburg Firstly the electron rearrangement dynamics in dissociating multiply charged iodine molecules is studied in an experiment that made it possible to access charge transfer in a thus far unexplored quasimolecular regime relevant for plasma and chemistry applications of the FEL Secondly the lifetime of an efficient non radiative relaxation process that occurs in weakly bound systems is measured directly for the first time in a neon dimer Ne₂ Interatomic Coulombic decay ICD has been identified as the dominant decay mechanism in inner valence ionized or excited van der Waals and hydrogen bonded systems the latter being ubiquitous in all biomolecules The role of ICD in DNA damage thus demands further investigation e g with regard to applications like radiation therapy

Scientific Assessment of High-Power Free-Electron Laser Technology National Research Council, Division on Engineering and Physical Sciences, Board on Physics and Astronomy, Committee on a Scientific Assessment of Free-Electron Laser Technology for Naval Applications, 2009-04-06 This book presents a scientific assessment of free electron laser technology for naval applications The charge from the Office of Naval Research was to assess whether the desired performance capabilities are achievable or whether fundamental limitations will prevent them from being realized The present study identifies the highest priority scientific and technical issues that must be resolved along the development path to achieve a megawatt class free electron laser In accordance with the charge the committee considered and briefly describes trade offs between free electron lasers and other types of lasers and weapon systems to show the advantages free electron lasers offer over other types of systems for naval applications as well as their drawbacks The primary advantages of free electron lasers are associated with their energy delivery at the speed of light selectable wavelength and all electric nature while the trade offs for free electron lasers are their size complexity and relative robustness Also Despite the significant technical progress made in the development of high average power free electron

lasers difficult technical challenges remain to be addressed in order to advance from present capability to megawatt class power levels

Introduction to the Physics of Electron Emission Kevin L.
