Stimulus-Secretion Coupling in Neuroendocrine Systems Brian Pickering, Detlev Ganten, Donald Pfaff, 2012-12-06
The role of electrical signalling in the control of endocrine secretions by the brain has been clear for many years. Recently the influences of hormones on synaptic events in neuroendocrine cells have raised new questions concerning the peptides released from such neurons. This volume concentrates on the relation between these two fields and asks how electrical action potentials facilitate secretion of substances from nerve cells which control endocrine events. While stimulus secretion coupling has been studied extensively in other physiological contexts, this is the first treatment of the phenomenon in an exclusively neuroendocrine setting. This volume covers new aspects and future directions in molecular neuroendocrinology, an important and rapidly growing area in neuroendocrinology. Among the various neurotransmitters or neuromodulators that play an important role in the control of endocrine functions, neuropeptides and related proteins have drawn special attention because of their diversity and complexity in action. More recently, molecular biology has become an essential tool of research in this area. Various genes encoding neuropeptides and other related proteins have been cloned and the regulation of expression of these genes has been studied extensively. Transgenic animals have been used in studying the function of the gene in question. In situ hybridization is being applied to localize the site of production and analyze the regulation of production of peptides or proteins. *Behavioral Aspects of Neuroendocrinology* Detlev Ganten, Donald Pfaff, 2012-12-06
