Sonar Signal Processing Nielsen:

Sonar Signal Processing Richard O. Nielsen, 1991 This discussion of sonar signal processing bridges a number of related fields including acoustic propagation in the medium detection and estimation theory filter theory digital filtering sensor array processing spectral analysis fast transforms and digital signal processing The book begins with a discussion of the topics of analogue signalling conditioning digital filtering and the calculation of the discrete Fourier transform Other topics discussed include analogue filters and analogue to digital conversion finite impulse and infinite impulse response digital filters and multirate processing techniques *Handbook of Signal Processing in Acoustics* David Havelock, 2008 **Underwater**

Acoustic Signal Processing Douglas A. Abraham, 2019-02-14 This book provides comprehensive coverage of the detection and processing of signals in underwater acoustics Background material on active and passive sonar systems underwater acoustics and statistical signal processing makes the book a self contained and valuable resource for graduate students researchers and active practitioners alike Signal detection topics span a range of common signal types including signals of known form such as active sonar or communications signals signals of unknown form including passive sonar and narrowband signals and transient signals such as marine mammal vocalizations This text along with its companion volume on beamforming provides a thorough treatment of underwater acoustic signal processing that speaks to its author's broad experience in the field **Sonar Systems** Nikolai Kolev, 2011-09-12 The book is an edited collection of research articles

covering the current state of sonar systems the signal processing methods and their applications prepared by experts in the field The first section is dedicated to the theory and applications of innovative synthetic aperture interferometric multistatic sonars and modeling and simulation Special section in the book is dedicated to sonar signal processing methods covering passive sonar array beamforming direction of arrival estimation signal detection and classification using DEMON and LOFAR principles adaptive matched field signal processing The image processing techniques include image denoising detection and classification of artificial mine like objects and application of hidden Markov model and artificial neural networks for signal classification The biology applications include the analysis of biosonar capabilities and underwater sound influence on human hearing The marine science applications include fish species target strength modeling identification and discrimination from bottom scattering and pelagic biomass neural network estimation methods Marine geology has place in the book with geomorphological parameters estimation from side scan sonar images The book will be interesting not only for specialists in the area but also for readers as a guide in sonar systems principles of operation signal processing methods and marine applications *Sonar Signal Processing*, 1995 **Principles of Radar and Sonar Signal Processing** François Le

Chevalier, 2002 **Advanced Signal Processing Handbook** Stergios Stergiopoulos, 2017-09-08 Advances in digital signal processing algorithms and computer technology have combined to produce real time systems with capabilities far beyond those of just few years ago Nonlinear adaptive methods for signal processing have emerged to provide better array gain

performance however they lack the robustness of conventional algorithms The challenge remains to develop a concept that exploits the advantages of both a scheme that integrates these methods in practical real time systems The Advanced Signal Processing Handbook helps you meet that challenge Beyond offering an outstanding introduction to the principles and applications of advanced signal processing it develops a generic processing structure that takes advantage of the similarities that exist among radar sonar and medical imaging systems and integrates conventional and nonlinear processing schemes

Echo Signal Processing Dennis W. Ricker, 2012-12-06 This book presents basic and advanced topics in the areas of signal theory and processing as applied to acoustic echo location sonar It is written at the advanced undergraduate or graduate level and assumes that the reader is conversant with the concepts and mathematics associated with introductory graduate courses in signal processing such as linear and complex algebra Fourier analysis probability advanced calculus and linear system theory The material is presented in a tutorial fashion as a logical development starting with basic principles and leading to the development of topics in detection and estimation theory waveform design echo modeling scattering theory and spatial processing Examples are provided throughout the book to illustrate important concepts and especially important relationships are boxed The book addresses the practical aspects of receiver and waveform design and therefore should be of interest to the practicing engineer as well as the student Although much of the book is applicable to the general echo location problem that includes radar its emphasis is on acoustic echo location especially in regard to time mapping and the wideband or wavelet description of Doppler Introductory signal theory material is included in the first chapter to provide a foundation for the material covered in the later chapters A consistent notational convention is observed throughout the book so that the various mathematical entities are readily identified This is described in the glossary and symbol list

Underwater Acoustic Digital Signal Processing and Communication Systems Robert Istepanian, Milica Stojanovic, 2013-03-09 Underwater acoustic digital signal processing and communications is an area of applied research that has witnessed major advances over the past decade Rapid developments in this area were made possible by the use of powerful digital signal processors DSPs whose speed computational power and portability allowed efficient implementation of complex signal processing algorithms and experimental demonstration of their performance in a variety of underwater environments The early results served as a motivation for the development of new and improved signal processing methods for underwater applications which today range from classical of autonomous underwater vehicles and sonar signal processing to remote control underwater wireless communications This book presents the diverse areas of underwater acoustic signal processing and communication systems through a collection of contributions from prominent researchers in these areas Their results both new and those published over the past few years have been assembled to provide what we hope is a comprehensive overview of the recent developments in the field The book is intended for a general audience of researchers engineers and students working in the areas of underwater acoustic signal processing It requires the reader to

have a basic understanding of the digital signal processing concepts Each topic is treated from a theoretical perspective followed by practical implementation details We hope that the book can serve both as a study text and an academic reference
