Craig, 2007-07-16 1 1 Introduction Object oriented programming has opened a great many perspectives on the concept of software and has been hailed as part of the solution to the so called software crisis It has given the possibility that software components can be constructed and reused with considerably more credibility There are now many case studies in which the reuse of object oriented components has been made and analysed Object oriented programming relates the programming activity to that of modelling or simulation objects are identified by a correspondence with the objects found in the application area of the program and are used to model those domain operations Object oriented programming also opens the prospect of more flexible software that is able to respond dynamically to the needs of the application at runtime It is very easy to think that object oriented programming can be performed in only one way The prevalence of C and Java suggests that they are the only way to approach the problem of what an object oriented programming language should look like There are many approaches to this way of programming and C and Java exemplify just one of these different approaches Indeed the way in which the concept of the object is interpreted differs between approaches and between languages The two main approaches found in object oriented programming languages are respectively class based and prototype based languages Class based languages are exemplified by Smalltalk 34 C 75 74 and Java 47 This 2 1 Introduction approach is based upon the identification of common properties of objects and their description in terms of a definitional structure called a class The objects manipulated by class based programs are the result of instantiating classes *Programming Languages and System Architectures* Jürg Gutknecht, 1994-02-22 Programming languages and system architectures are at the frontiers of two different worlds The conference on which this book is based was an adventure in a land where the two worlds the formal world of algorithms and the physical world of electronic circuits interact The participants explored this land under the guidance of internationally renowned researchers such as Butler W Lampson Susan Graham Jan L A van de Snepscheut and C A R Hoare all of whom

gave invited papers The volume includes these papers together with sixteen session papers Subjects of special interest include programing language design and history programming environments programming methods operating systems compiler construction and innovative system architectures **ACM SIGPLAN Notices** ,2005-07
