

15.2 Sex-linked genes inheritance patterns_____

9. Compare the X and Y chromosomes in Mammals.

X = larger, has more genes, two found in females, one in males

Y = smaller, has fewer genes, one in males, none in females

10A. Following Meiosis in mammals, each ovum (egg) contains one X (X or Y) sex chromosome, whereas following meiosis in males each sperm cell has either an X OR Y chromosome.

10B. Which gender M/F determines the sex of offspring in mammals? Male

11. Your friend Bill has a “sex-linked” disease. Which chromosome, X or Y, is more likely to contain the mutant allele that is responsible for Bill’s disease Why?

X-because it is bigger than the Y, it has many more genes. For this reason, if a person has a “sex-linked disease” it is most likely on the X chromosome. It is so rare to have a sex-linked disease as a result of a mutant gene on the Y chromosome that sex-linked diseases are also called X-linked diseases.

12. In mammals, sex-linked genes are passed from Father’s to daughters (daughters/son) only. Mother’s can pass sex-linked genes to sons OR daughters.

13A. Name at least two sex-linked disorders found in humans. Colorblindness, hemophilia

13B. Why are sex-linked disorders more common in males?

More common in males because males only have one X chromosome, whereas females have two X chromosomes. If a male inherits an X chromosome from his mom with a diseased allele, he will have the disease because he has only one X chromosome and does not have another X chromosome to inherit a good (non-diseased allele). Females, because they have two X chromosomes, have two chances to inherit a non-diseased allele.
