

20 Reflection, Refraction, and Dispersion

No prerequisites; Chapters 10 and 11 suggested

The phenomena that form the subject of this chapter—reflection, refraction, and dispersion of light—are among the most common of our everyday experience. The first two are so common, in fact, that we are seldom aware of their existence. The third is what gives us the beautiful colors of the rainbow.

OBJECTIVES

After completing this chapter, you will be able to

- compare the angles of incident and reflected light;
- differentiate between specular and diffuse reflection;
- determine relative size and position of the object and image in a plane mirror;
- differentiate between reflection and refraction;
- explain how the speed of light affects refraction;
- compare the wavelengths of light in two materials where the speed of light differs;
- specify the meaning of “total internal reflection” and state the conditions necessary for its occurrence;
- explain the effect of refraction on our perception of sunset;
- explain the cause of mirages in terms of the phenomena presented in this chapter;
- specify the relationship of dispersion to refraction;
- state the cause of rainbows;
- determine the angle of refraction, given the angle of incidence of light and the speed of light in each material (optional);
- determine the angle of refraction, given the angle of incidence of light and the index of refraction of each material (optional);
- determine the critical angle for total internal reflection between two substances, given the index of refraction of each (optional);
- calculate the speed of light in a substance given the index of refraction of the substance (optional).
