Passive Network Synthesis: An Approach to Classification Alessandro Morelli, Malcolm C. Smith, 2019-05-21. A resurgence of interest in network synthesis in the last decade motivated in part by the introduction of the inerter has led to the need for a better understanding of the most economical way to realize a given passive impedance. This monograph outlines the main contributions to the field of passive network synthesis and presents new research into the enumerative approach and the classification of networks of restricted complexity. *Passive Network Synthesis: An Approach to Classification* serves as both an ideal introduction to the topic and a definitive treatment of the Ladenheim catalogue. In particular the authors provide a new analysis and classification of the Ladenheim catalogue building on recent work to obtain an improved understanding of the structure and realization power of the class within the biquadratic positive real functions. This book is intended for researchers in systems and control, real algebraic geometry, electrical and mechanical networks and dynamics and vibration.

Qualitative topics in integer linear programming Valery N. Shevchenko, 1996-10-15. Integer solutions for systems of linear inequalities, equations and congruences are considered along with the construction and theoretical analysis of integer programming algorithms. The complexity of algorithms is analyzed dependent upon two parameters: the dimension and the maximal modulus of the coefficients describing the conditions of the problem. The analysis is based on a thorough treatment of the qualitative and quantitative aspects of integer programming in particular on bounds obtained by the author for the number of extreme points. This permits progress in many cases in which the traditional approach which regards complexity as a function only of the length of the input leads to a negative result.
