The Calculus Of Computation Decision Procedures With Applications To Verification:

The Calculus of Computation Aaron R. Bradley, Zohar Manna, 2007-09-18 Computational logic is a fast growing field with applications in artificial intelligence constraint solving and the design and verification of software and hardware systems Written with graduate and advanced undergraduate students in mind this textbook introduces computational logic from the foundations of first order logic to state of the art decision procedures for arithmetic data structures and combination theories This textbook also presents a logical approach to engineering correct software The increasing ubiquity of computers makes implementing correct systems more important than ever Verification exercises develop the reader's facility in specifying and verifying software using logic The treatment of verification concludes with an introduction to the static analysis of software an important component of modern verification systems For readers interested in learning more about computational logic decision procedures verification and other areas of formal methods the final chapter outlines courses of further study The

Computation: Decision Procedures With Applications To Verification Bradley, 2009-09-01 Logic for Programming, Artificial Intelligence, and Reasoning Iliano Cervesato, Helmut Veith, Andrei Voronkov, 2008-11-13 This book constitutes the refereed proceedings of the 15th International Conference on Logic for Programming Artificial Intelligence and Reasoning LPAR 2008 which took place in Doha Qatar during November 22-27 2008 The 45 revised full papers presented together with 3 invited talks were carefully revised and selected from 153 submissions The papers address all current issues in automated reasoning computational logic programming languages and their applications and are organized in topical sections on automata linear arithmetic verification knowledge representation proof theory quantified constraints as well as modal and temporal logics

Graph Structure and Monadic Second-Order Logic Bruno Courcelle, Joost Engelfriet, 2012-06-14 The study of graph structure has advanced in recent years with great strides finite graphs can be described algebraically enabling them to be constructed out of more basic elements Separately the properties of graphs can be studied in a logical language called monadic second order logic In this book these two features of graph structure are brought together for the first time in a presentation that unifies and synthesizes research over the last 25 years The authors not only provide a thorough description of the theory but also detail its applications on the one hand to the construction of graph algorithms and on the other to the extension of formal language theory to finite graphs Consequently the book will be of interest to

graduate students and researchers in graph theory finite model theory formal language theory and complexity theory

Modeling Time in Computing Carlo A. Furia, Dino Mandrioli, Angelo Morzenti, Matteo Rossi, 2012-10-19 Models that include a notion of time are ubiquitous in disciplines such as the natural sciences engineering philosophy and linguistics but in computing the abstractions provided by the traditional models are problematic and the discipline has spawned many novel models This book is a systematic thorough presentation of the results of several decades of research on developing analyzing and applying time models to computing and engineering After an opening motivation introducing the topics structure and goals the authors introduce the notions of formalism and model in general terms along with some of their fundamental classification criteria In doing so they present the fundamentals of propositional and predicate logic and essential issues that arise when modeling time across all types of system Part I is a summary of the models that are traditional in engineering and the natural sciences including fundamental computer science dynamical systems and control theory hardware design and software algorithmic and complexity analysis Part II covers advanced and specialized formalisms dealing with time modeling in heterogeneous software intensive systems formalisms that share finite state machines as common ancestors Petri nets in many variants notations based on mathematical logic such as temporal logic process algebras and dual language approaches combining two notations with different characteristics to model and verify complex systems e g model checking frameworks Finally the book concludes with summarizing remarks and hints towards future developments and open challenges The presentation uses a rigorous yet not overly technical style appropriate for readers with heterogeneous backgrounds and each chapter is supplemented with detailed bibliographic remarks and carefully chosen exercises of varying difficulty and scope The book is aimed at graduate students and researchers in computer science while researchers and practitioners in other scientific and engineering disciplines interested in time modeling with a computational flavor will also find the book of value and the comparative and conceptual approach makes this a valuable introduction for non experts The authors assume a basic knowledge of calculus probability theory algorithms and programming while a more advanced knowledge of automata formal languages and mathematical logic is useful
