A Bridge to Higher Mathematics James R. Kirkwood, Raina S. Robeva, 2024-05-08 The goal of this unique text is to provide an experience that would facilitate a better transition for mathematics majors to the advanced proof based courses required for their major If you feel like you love mathematics but hate proofs this book is for you The change from example based courses such as Introductory Calculus to the proof based courses in the major is often abrupt and some students are left with the unpleasant feeling that a subject they loved has turned into material they find hard to understand The book exposes students and readers to some fundamental content and essential methods of constructing mathematical proofs in the context of four main courses required for the mathematics major probability linear algebra real analysis and abstract algebra Following an optional foundational chapter on background material four short chapters each focusing on a particular course provide a slow paced but rigorous introduction Students get a preview of the discipline its focus language mathematical objects of interest and methods of proof commonly used in the field The organization of the book helps to focus on the specific methods of proof and main ideas

that will be emphasized in each of the courses The text may also be used as a review tool at the end of each course and for readers who want to learn the language and scope of the broad disciplines of linear algebra abstract algebra real analysis and probability before transitioning to these courses

Complete Solutions Manual, James Stewart, Multivariable Calculus, Metric Version, 7th Edition, 2012 Advanced Linear Algebra Nicholas A. Loehr, 2024-06-21

Designed for advanced undergraduate and beginning graduate students in linear or abstract algebra Advanced Linear Algebra covers theoretical aspects of the subject along with examples computations and proofs It explores a variety of advanced topics in linear algebra that highlight the rich interconnections of the subject to geometry algebra analysis combinatorics numerical computation and many other areas of mathematics The author begins with chapters introducing basic notation for vector spaces permutations polynomials and other algebraic structures The following chapters are designed to be mostly independent of each other so that readers with different interests can jump directly to the topic they want This is an unusual organization compared to many abstract algebra textbooks which require readers to follow the order of chapters Each chapter consists of a mathematical vignette devoted to the development of one specific topic Some chapters look at introductory material from a sophisticated or abstract viewpoint while others provide elementary expositions of more theoretical concepts Several chapters offer unusual perspectives or novel treatments of standard results A wide array of topics is included ranging from concrete matrix theory basic matrix computations determinants normal matrices canonical forms matrix factorizations and numerical algorithms to more abstract linear algebra modules Hilbert spaces dual vector spaces bilinear forms principal ideal domains universal mapping properties and multilinear algebra The book provides a bridge from elementary computational linear algebra to more advanced abstract aspects of linear algebra needed in many areas of pure and applied mathematics
