Software Engineering With Reusable Components:

Software Engineering with Reusable Components Johannes Sametinger, 2013-04-17 Software is rarely built completely from scratch To a great extent existing software documents source code design documents etc are copied and adapted to fit new requirements Yet we are far from the goal of making reuse the standard approach to software development Software reuse is the process of creating software systems from existing software rather than building them from scratch Software reuse is still an emerging discipline It appears in many different forms from ad hoc reuse to systematic reuse and from white box reuse to black box reuse Many different products for reuse range from ideas and algorithms to any documents that are created during the software life cycle Source code is most commonly reused thus many people misconceive software reuse as the reuse of source code alone Recently source code and design reuse have become popular with object oriented class libraries application frameworks and design patterns Software components provide a vehicle for planned and systematic reuse The software community does not yet agree on what a software component is exactly Nowadays the term component is used as a synonym for object most of the time but it also stands for module or function Recently the term component based or component oriented software development has become popular In this context components are defined as objects plus something What something is exactly or has to be for effective software development remains yet to be seen However systems and models are emerging to support that notion

Observers in the present usually have an advantage when it comes to interpreting events of the past In the case of software reuse however it is unclear why an idea that has gained such universal acceptance was the source of swirling controversy when it began to be taken seriously by the software engineering community in the mid 1980s From a purely conceptual point of view the reuse of software designs and components promises nearly risk free benefits to the developer Virtually every model of software cost and development effort predicts first order dependencies on either products size or the number of steps carried out in development Reduce the amount of new product to be developed and the cost of producing the product decreases Remove development steps and total effort is reduced By reusing previously developed engineering products the amount of new product and the number of development steps can be reduced In this way reuse clearly has a major influence on reducing total development cost and effort This of course raises the issue of from whence the reused products arise There has to be a prior investment in creating libraries of reuse products before reuse can be successful How can organizations with a bottom line orientation be enticed into contributing to a reuse venture Fortunately the economics of reuse resembles many other financial investment situations
